

```

// 内嵌
@ResponseBody
@RequestMapping(value = "/download",produces="application/octet-stream")
public byte[] downloadFile(HttpServletRequest request, HttpServletResponse response,String contentType2)
    throws IOException {
    byte[]bytes=FileUtils.getBytes4File("D:\\Temp\\cc.jpg");
    response.addHeader("Content-Disposition", "inline;filename=\"a.jpg\"");
    return bytes;
}

//下载
@ResponseBody
@RequestMapping(value = "/download",produces="image/jpeg")
public byte[] downloadFile(HttpServletRequest request, HttpServletResponse response,String contentType2,String downloadType)
    throws IOException {
    byte[]bytes=FileUtils.getBytes4File("D:\\Temp\\cc.jpg");
    response.addHeader("Content-Disposition", downloadType+";filename=\"a.jpg\"");
    return bytes;
}

```

因为response content type设置成了"application/octet-stream"

注意:我们说是内嵌显示还是下载,那一定是针对可内嵌显示的类型,例如"image/jpeg","image/png"等.
